7 Secrets The Pet Food Industry Doesn't Want You To Know

1. Corn – Corn is one of the hardest grains to digest. A human has about 34 feet of intestine. With a long intestinal tract, humans have a difficult time digesting it. A dog only has about 6 feet of intestines. It is impossible for them to digest corn. A better grain source is rice or oatmeal.

2. BHA – This preservative has been linked to liver and kidney problems, birth defects, metabolic stress, behavioral problems, and allergic reactions in laboratory animals. What could it possibly be doing to our pets?

3. BHT – See BHA.

4. Ethoxiquin – The FDA and some of the large pet food companies say that ethoxiquin is safe for pet food, but some would disagree, blaming this preservative on chronic maladies that have been affecting purebred dogs at an alarming frequency.

5. Dyes – A prime example of generic labeling is that of “artificial colors.” By law, the manufacturer doesn't have to list any ingredients on the bag and often does so in a manner which tells us little of what is actually in the product. The following dyes are either known carcinogens or have not been fully tested: Red #40, Red #3, Yellow #5, Yellow #6, Blue #1 and Blue #2. Animals ingest much larger amounts of these dyes and other chemicals in their daily diets than is ever allowed for humans.

6. Salt – An ingredient heavily used to help increase palatability. It has been believed to be the trigger of many diseases. Excessive salt intake can lead to hypertension, kidney stress, and colon irritation. A balance of sodium is vital for cellular health, but excessive amounts can damage these structures.

7. Sweeteners – Beet pulp sugar, sucrose, corn syrup, and molasses are the most widely used sweeteners in the pet food industry. Corn syrup is also known as an effective humectant and plasticizer, that is, an ingredient which gives the product dampness and flexibility.
